

IN THE CLAIM

Please cancel Claims 1 to 3, without prejudice or disclaimer of the subject matter thereof, and add new claim 4. The added new claim 4 is the combination of original claim 1, 2, and 3, and a feature that “wherein said operating rod 33 is protruded from an front upper end of the toilet.”, which is illustrated in Fig. 1 clearly. Thereby, it is assured that the new claims are based on the original claim and drawings and thus no new matter is added. The relation of the new claims with respect to the original claims are shown in the following REMARK, Examiners can read the claims more easily from the REMARK.

What is claimed is:

Claims 1 –3 (Cancelled)

Claim 4. (New Claim) A water-saving toilet comprising a bowl, a water tank, a two-stage flush button for flushing out two different volumes of water from said water tank into said bowl, a water-storing area formed in a bottom of said bowl, a bent passageway formed behind said water-storing area communicating with a drain way, said drain way connected to a drain pipe for wastes to pass through;

said water-storing area having a vertical through hole in its bottom, a valve control device positioned in said bowl and consisting of a valve, a valve cap, a drive rod, and an operating rod; said valve positioned in said through hole of said water-storing area and having a vertical passageway, said vertical passageway connecting said water-storing area with said drain way, said valve cap deposited on said valve to close and open said valve, a push rod connected downward to said valve

cap, said push rod extending in said vertical passageway of said valve, said push rod having its lower end pivotally connected to a left end of said drive rod, the right end of said drive rod connected with a lower end of said operating rod, said operating rod having its upper end protruding and exposing out of said bowl to be pushed down manually; and,

said outer end of said operating rod exposing out of said bowl pressed down to force said drive rod move said push rod upward to push up the valve cap to open said valve normally closed in case of using said water-saving toilet, urine of a user mixed with the water in the water-storing area flowing down through said vertical passageway down to said drain way in case of said valve opened, said two-stage flush button pressed to flush out a low volume of water from said water tank into the interior of said bowl through the water-storing area, said bent passageway, said drain way and then into said drain pipe, said toilet cleaned with the low volume of water every time of flushing to save water volume after every round of urinating;

said drive rod of said valve control device having the right end connected with the left end of a connect rod, the right end of said connect rod connected to said operating rod; said drive rod having a ball block fitted around an intermediate portion near the left end, said ball block contained in a chamber connected to said valve, said ball block functioning as a fulcrum to let the left end of said drive rod move upward when said drive rod is moved down by said operating rod;=

said operating rod having a press button fixed on the outer end for a user to manually press down.
